How to export personal statistics to a CSV file

Background

With Lightkey, you can gain access to your everyday productivity metrics, including time saved, typing speed (WPM), daily typing time and much more. The business edition of Lightkey aggregates the users' statistics and lets pre-defined managers export reports in CSV format. However, in some cases, creating a shared folder for the organization is not an option. Therefore, we've added a command line export feature that essentially collects exported CSV files from pre-defined local machines of individual users.

** Please note that this command will run only if Lightkey's Control Center is running. If you choose to trigger this command immediately after user login, please add a 60 second delay to let Lightkey to load properly. You can do this by creating a batch file and adding TIMEOUT 60 prior to the export operation.

How to export personal statistics using command line to a custom folder

Open a command line window (CMD of PowerShell) and set the current folder to

```
%PROGRAMFILES(X86)%\Lightkey Sources Ltd\Lightkey
```

Run the following command

```
LightkeyControlCenter.exe /export_personal_statistics <path>
```

© All rights reserved

A few notes:

- Make sure that the system running the command has the permissions to access the output path.
- The output path can be either a folder name or a full path including the filename. If you only specify a folder name, Lightkey will set the filename using the following format: *Lightkey.Statistics.Personal.20220112-113332.csv* (the digits at the end of the file represent the current date in reverse order (year, month, day, hour, minute, second).
- If the path argument has spaces in it, please make sure that the argument is wrapped in double quotes.

How to export personal statistics using command line to the local user profile

Open a command line window (CMD of PowerShell) and set the current folder to

```
%PROGRAMFILES(X86)%\Lightkey Sources Ltd\Lightkey
```

Run the following command

```
LightkeyControlCenter.exe /export_personal_statistics
```

Copy the most recently created CSV file from the following folder to your target folder

```
%LOCALAPPDATA%\Lightkey\ControlCenter\PersonalStatistics
```
